

Tips for Professional Tables

Simple tables can be created in `BEAMER` with the `tabular` environment:

```
\begin{tabular}[position]{table spec}  
:  
:  
\end{tabular}
```

The following symbols are available to describe the table columns:

<code>l</code>	left-justified column
<code>c</code>	centered column
<code>r</code>	right-justified column
<code>p{width}</code>	paragraph column with text vertically aligned at the top
<code> </code>	vertical line
<code> </code>	double vertical line

Note: \LaTeX won't wrap the text in a column if it is too wide for the page. With `p{width}` you can define the width of the column and the text will be wrap-around.
